ABSTRACT

This study provides a thorough examination of the impact of social media advertising on public perception in Panabo City, Philippines. The impact of social media platforms such as Facebook, Instagram, YouTube, and Twitter on consumer behavior and society ideals must be comprehended, given their extensive reach. By concentrating on a particular local location and closely examining factors including entertainment value, personal preferences, social imaging, and its influence, this study fills a significant research gap. With a solid theoretical foundation, the research uses the Unified Theory of Acceptance and Use of Technology (UTAUT) to investigate how public perception and social media advertising are related. Data were gathered using strict random sampling procedures from a subset of Panabo City barangays, including Barangay New Pandan, New Visayas, San Francisco, San Vicente, and Gredu. A correlational solid research design was employed. Key findings indicate that the type of social media platform used and demographic characteristics have an impact on modifications in public perception. The findings of the study underscore the significance of customized advertising tactics and regulatory structures in enhancing consumer involvement and mitigating adverse effects. The study ultimately concludes that public perception can be improved through social media advertising, which could improve customer engagement and even increase conversions. The results enhance our

comprehension of the influence of social media advertising on public opinion in specific settings.

Keywords: Advertising, Consumer behavior, Correlational, Social Media, Perception,

1. INTRODUCTION

1. Background of the Study

Nowadays, social media is a big part of our daily lives, and it really affects how we think and what we do. While other research has explored the effects of social media advertising on consumer behavior and perceptions globally, The literature on consumer choice between global and local brands is focused on sales-based measures of brands globally [1]. There remains a gap in understanding its impact within specific geographic contexts, such as Panabo City, Philippines. This study aims to address this gap by investigating the influence of social media advertising on public perception in Panabo City, considering variables such as entertainment value, familiarity, social imaging, and advertisement spending. The research will explore the challenges and opportunities posed by social media advertising in the local context, with implications for regulatory oversight, consumer education, industry self-regulation, and community involvement.

Social media has become a big part of our daily lives [2]. States that platforms like Facebook, Twitter, Instagram, and YouTube are super popular, and lots of people use them every day. This means they have a significant influence on how we think and act. Because of this, there's a growing interest in understanding how ads on social media affect what we buy and how we see things. Studies have looked into social media ads and how they affect what people think and do [3]. Some studies have looked at how important social media is for businesses to talk to their customers. That can help to improve business process in a specific organization. Others have looked at how famous people on social media, called influencers, can change what people think

about products. Additionally, studies have compared regular ads with social media ads to see which ones work better [4]. Especially in the fashion world, social media ads are a really big deal. Fashion brands use social media to get people interested in their clothes and to get them to buy stuff. Researchers are also interested in how ads on social media talk to us. They've noticed that as things change in the world and how people buy stuff, ads on social media have to change, too. [5] Said that they need to use words that make us want to buy things, and they need to keep up with what's happening in society.

The seriousness of the problem stems from how social media ads deeply affect how people act and what they think, not just about buying things, but also about society's ideas and values. It's essential to understand how this happens in Panabo City because it's different there, with its own culture and way of life. Regular studies might not pay enough attention to these differences, so we might not fully grasp how people react to ads. Some issues include ads concerning in trends and Influence behavior and false information spreading. This explains how advertising works by employing a psycho-cultural approach, encouraging readers to think about advertisements and commercials in more analytical and profound ways [6]. The solutions include making rules for ads through regulatory oversight, teaching people about ads through consumer education, making companies follow good rules on their own through industry self-regulation, involving the community, and doing more research to make sure ads are helpful, not harmful.

Identified key variables of social media advertising that influence consumer buying behavior, including entertainment value, familiarity, social imaging, and advertisement spending. [7] States that these variables underscore the multifaceted nature of social media advertising and its impact on consumer decision-making processes. As businesses increasingly integrate their marketing activities into social media platforms, new challenges and

opportunities emerge. In this study, Organizations invest significant resources in social media advertising, recognizing its potential to reach and engage target audiences effectively.

Despite the growing body of literature on social media advertising, there remains a need for further research, particularly in understanding its impact on public perception in specific geographic contexts. Therefore, this study aims to investigate the impact of social media advertising on public perception in Panabo City, Philippines.

2. Theoretical framework

A combined theoretical framework is used in this study. The independent variable impact of social media advertising will be based on the Unified Theory of Acceptance and Use of Technology. Venkatesh et al. developed the Unified Theory of Acceptance and Use of Technology in 2003. Unified Theory of Acceptance and Use of Technology states that elements such as performance expectancy, effort expectancy, social impact, and enabling conditions all influence an individual's decision to accept and use technology [10]. UTAUT study shows that user-friendly interfaces and smooth interaction with platforms increase technology adoption. Similarly, user-friendly social media advertising promotes favorable public perception.

Furthermore, the dependent variable public perception will be examined using the Elaboration Likelihood Model Theory. The Elaboration Likelihood Model Theory was developed by Richard E. Petty and John Cacioppo in 1980. Elaboration relates to how much work an audience member must expend to comprehend and analyze a message, recall it, and accept or reject it. Specifically, the ELM showed that when presented with a message, people respond via one of two channels or a combination of both, reflecting the level of effort required. As a result, individuals experience either high or low elaboration, determining whether they use central

or peripheral pathway processing [8]. Studies have revealed that the effectiveness of social media advertising is determined on the message's quality and capacity to engage users. This is consistent with ELM's central route processing, in which solid arguments and engaging pictures result in positive perceptions.

By integrating ELM and UTAUT, this study will be able to examine how social media advertising influences public perception. UTAUT discusses the elements that impact the adoption and use of social media advertising. Technology adoption is both a cultural issue and a logical decision-making process. Because technology is utilized in a variety of circumstances, culture is likely to influence its adoption and use [9]. At the same time, ELM focuses on the cognitive processes involved in creating perceptions based on message quality, user experience, and social influence inside the ad. The ELM originated as a theory about the process that causes attitude change and the strength of the attitudes that come from those processes [10].

3. Conceptual Framework

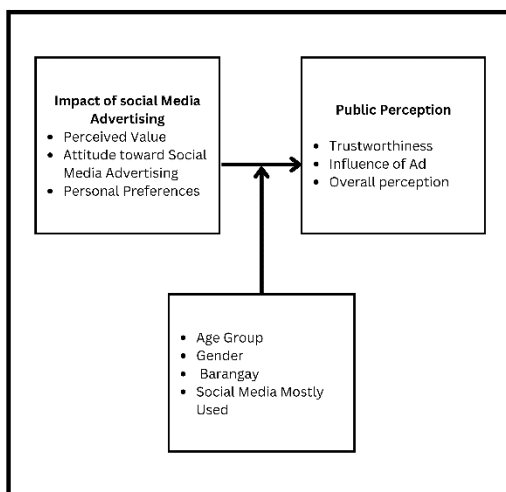

Figure 1. Conceptual Framework of the study

This shows the relationship between Social Media Advertising and Public Perception in Panabo City. On the left side is the Dependent

Variable, which depends on how individuals or groups of people view certain entities, goods, services, or concepts. On the right side is the Independent Variable, which concerns the advantages and disadvantages of using social media sites for marketing.

4. Research Questions

This study examines the Impact of Social Media Advertising on Public Perception in Panabo City. This study aims to respond to the following specific questions:

RQ1. What is the demographic profile of the participants of the study in terms of:

- 1.1 Age Group
- 1.2 Gender
- 1.3 Barangay
- 1.4 Social Media Mostly Used

RQ2. What is the level of the impact of Social Media Advertising in terms of:

- 2.1 Perceived Value
- 2.2 Attitude Towards Social Media Advertising
- 2.3 Personal Preferences

RQ3. What is the level of Public Perception in terms of:

- 3.3 Trustworthiness
- 3.4 Influence of Ad
- 3.5 Overall Perception

RQ4: Is there a significant difference in the level of the impact of Social Media Advertising in terms of:

- 1.1 Age Group
- 1.2 Gender
- 1.3 Barangay
- 1.4 Social Media Mostly Used

RQ5. Is there a significant difference in the level of Public Perception when grouped according to:

- 1.1 Age Group
- 1.2 Gender
- 1.3 Barangay
- 1.4 Social Media Mostly Used

RQ6. Is there a significant relationship between Social Media Advertising and Public Perception?
RQ7. Does Social Media Advertising give impact on the Public Perception in Panabo City?

5. Null Hypothesis

Ho1. There is no significant difference in the level of social media advertising when grouped according to

- 1.1 Age Group
- 1.2 Gender
- 1.3 Barangay
- 1.4 Social Media Mostly Used

Ho2. There is no significant difference in the level of public perception when grouped according to:

- 1.1 Age Group
- 1.2 Gender
- 1.3 Barangay
- 1.4 Social Media Mostly Used

Ho3. There is no significant relationship between the level of social media advertising and the level of public perception in Panabo City.

Ho4. There is no significant influence on the level of social media advertising and the level of public perception in Panabo City.

2. METHODOLOGY

This section outlines the overall strategy for integrating relevant empirical research with conceptual research problems. The research design employed for this study is correlational research, which investigates the association between social media advertising and public perceptions in Panabo City. This design is chosen for its effectiveness in identifying and quantifying relationships among naturally occurring variables

2.1 Research Design

This section of the study focuses on the overall strategy for bringing together relevant empirical research with conceptual research problems. The appropriate research design for this topic is correlational research, which

examines the association between the impact of social media advertising on public perceptions at Panabo City. [11]. Social media influencers are first explored in the advertising field, particularly to create buzz in the younger markets and further expand social media coverage in businesses.

The goal of correlational research is to find relationships. Significant correlations across data, rendering them an excellent option for this study's quantitative analysis. Relationship-based study makes it possible to examine naturally existing connections. [12]. Consumer perceptions of advertising creativity are investigated in a series of studies beginning with scale development and ending with comprehensive model testing. Results demonstrate that the interaction between divergence and relevance determines perceptions of ad creativity, and that overall creativity mediates their effects on consumer processing and response.

2.2 Research Locale

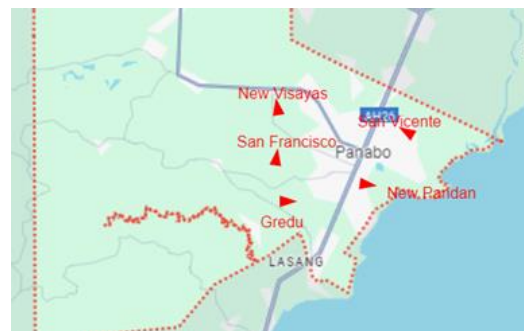

Figure 2. Research Locale

The research, titled "Exploring the Impact of Social Media Advertising on Public Perceptions in Panabo City," was carried out in Barangay New Pandan, Barangay New Visayas, Barangay San Francisco, Barangay San Vicente, and Barangay Gredu. Panabo City was selected as the research site due to its diverse population actively engaged with social media, and the study participants had connections to the area.

2.3 Participants of the Study

The research, titled "Exploring the Impact of Social Media Advertising on Public Perceptions in Panabo City," was carried out in Barangay New Pandan with a 18, 487 population, Barangay New Visayas with a 8, 987 population, Barangay San Francisco with a 13, 953 population, Barangay San Vicente with a 13, 334 population, and Barangay Gredu with a 16, 252 population. Panabo City was selected as the research site due to its diverse population actively engaged with social media, and the study participants had connections to the area.

2.4 Sampling Techniques

For this study, researchers chose to employ random sampling. Random sampling entails selecting participants from the target population in a completely random manner, ensuring every member has an equal chance of inclusion [13]. Random sampling entails selecting participants from the target population in a completely random manner, ensuring every member has an equal chance of inclusion. This approach minimizes biases and improves the study's ability to generalize findings [14]. A sampling method is biased if every member of the population doesn't have an equal likelihood of being in the sample.

Thus, random sampling is deemed the most suitable technique for the quantitative research study titled "Exploring the Impact of Social Media Advertising on Public Perception in Panabo City." Random sampling offers several advantages over alternative methods, including providing a representative sample that accurately mirrors the population's characteristics and reducing sampling bias. It also fosters transparency

and objectivity by eliminating researcher bias in participant selection. Researchers opted for random sampling because it ensures population representation, reduces biases, is efficient, and enhances transparency and objectivity.

This technique enhances study validity and allows findings to be generalized to the population, rendering it a valuable tool in quantitative research. This type of approach minimizes biases and improves the study's ability to generalize findings. Thus, random sampling is deemed the most suitable technique for this. Random sampling offers several advantages over alternative methods, including providing a representative sample that accurately mirrors the population's characteristics and reducing sampling bias. It also fosters transparency and objectivity by eliminating researcher bias in participant selection. Researchers opted for random sampling because it ensures population representation, reduces biases, is efficient, and enhances transparency and objectivity. This technique enhances study validity and allows findings to be generalized to the population, rendering it a valuable tool in quantitative research.

The research used Slovin's formula alongside a stratified random sampling technique to determine the sample size for each barangay. Slovin's method, widely utilized in research, aims to generate a representative sample while keeping the survey manageable for large populations. This formula is expressed as:

Slovin Formula:
$$n = \frac{N}{1 + Ne^2}$$

where n represents the sample size, N denotes the population size, and e stands for the margin of error, indicating the desired level of precision.

The research effectively determined the appropriate sample size for each barangay using Slovin's formula, ensuring that the survey findings are statistically meaningful and reflective of the community. Below are the outcomes of the sampling method used by the researchers:

Total population: 77076

Sample size: 193.69 (Slovin Formula Results)

Barangay	Population Area	The Number of People in the Sample	Stratum
GREDU	16,252	$397.9/77076 \times 016,252$	84
SAN VICENTE	19,334	$397.9/77076 \times 19,334$	100
NEW PANDAN	8,550	$397.9/77076 \times 8,550$	44
SAN FRANCISCO	13, 953	$397.9/77076 \times 18,987$	72
NEW VISAYAS	18, 987	$397.9/77076 \times 18,987$	98

Table 1. Sampling Technique of the Study

2.5 Statistical Treatments

The researchers recognized the need for statistical expertise to analyze and interpret the data effectively. Frequency [15] and percentages [16] would reveal how many participants fell into different categories like age group, gender, and social media platform.

Percentage formula:

$$P = (f/n) \times 100$$

Where:

- P is percentage
- f is frequency
- n is the number of cases or total sample

The mean [17] would summarize public perception across these groups. To assess variations in public perception based on demographics and social media use, they would employ Analysis of Variance (ANOVA). This technique helps identify statistically significant differences when comparing the means of the group [18]. Based on demographic data and other variables, these tests will assist in identifying any statistically significant variations in social media advertising and public perception levels.

Anova Formula:

$$f = MSB/MSW$$

Wherein:

- F = ANOVA Coefficient
- MSB = Mean of the total of squares between groupings. This is obtained by dividing the total variation **explained by the differences between groups** (sum of squares between) by the number of groups we're comparing (degrees of freedom between).
- MSW = Mean total of squares within groupings. It's calculated by dividing the total variation **within each group** (sum of squares within) by the total number of data points minus the number of groups (degrees of freedom within).

T-Test is also helpful for understanding differences between groups. Lastly, Pearson's correlation coefficient (Pearson R) [19] would then be used to explore the strength and direction of the relationship between social media advertising and public perception. Slovin's formula ensured a statistically robust sample size for each barangay within the study area [20]. This formula, combined with stratified random sampling, guaranteed a representative and manageable survey population.

Pearson r formula:

$$r = \frac{n \sum XY - \sum X \sum Y}{\sqrt{(n \sum X^2 - (\sum X)^2) \cdot (n \sum Y^2 - (\sum Y)^2)}}$$

Wherein:

- N = the number of pairs of scores
- Σxy = the sum of the products of paired scores
- Σx = the sum of x scores
- Σy = the sum of y scores
- Σx^2 = the sum of squared x scores
- Σy^2 = the sum of squared y scores

2.6 Data Collection Procedure

The researchers used survey administration software to gather data and information, the Google form, to answer the online survey questionnaires, which can be answered only by the college students in Panabo City. A questionnaire that is responded to online is known as a web-based survey. It is a technique for quickly and effectively gathering information from many people. Google Forms is a cloud-based data management tool for designing and developing web-based questionnaires. Google Inc. Google Forms provide this tool provides an easy-to-use web interface for designing and developing web-based survey questionnaires [21].

2.7 Research Instrument

This research was adopted from two variables. First, the research looks at public perception. This describes how the public perceives a specific issue, product, brand, or concept. Traditional media, word-of-mouth recommendations, and personal experiences can all have an impact on public perception. Understanding public perception is essential for any business or individual looking to engage an audience effectively. This research aims to explore consumers' perspectives and experiences with social media advertisements. This was formed from the worry of consumers' emotions and viewpoints, as well as the requirement of forecasting their evaluation of such advertisements [22].

Second, the study investigates social media advertising. Social media advertising uses sites like Facebook, Instagram, and Twitter to send customized advertisements to specific audiences. This type of advertising has grown in

popularity owing to its capacity to reach a vast number of users and generate high levels of interaction. Companies are increasingly using social media platforms as a promotional tool, and they favor highly engaging social media since it allows customers to communicate and network more effectively [23].

An online survey is used to collect the essential information that is needed for this research. The researchers utilized Google Forms, a free online survey tool, to create and disseminate the survey questionnaire and analyze the data that was collected easily. Modern online survey methods include three key components: questionnaire design, dissemination, and reporting. Simple polls are already integrated into Facebook and Twitter. Google Forms is perfect for delivering a quick questionnaire, tracking the results, and exporting them to a spreadsheet. It supports many question types, including text boxes, paragraph texts, multiple choice, checkboxes, scales, and grids. It enables custom logic to go through questions based on replies. Built-in data validation procedures ensure accurate questions based on past replies [24].

2.8 Ethical Considerations

Ethical considerations regarding the privacy and safety of personal information collected in the research study "Exploring Impact of Social Media Advertising on Public Perceptions on Panabo City." are of utmost importance. To ensure participant confidentiality and privacy, several measures will be implemented. Firstly, participants' personal information, such as names, would be collected separately from their responses to maintain anonymity. Secondly, the data collected would be stored securely and accessible only to authorized researchers involved in the study. Handling these issues and ensuring security and privacy for the Internet of Things products and services must be a fundamental priority. Users need to trust the Internet of Things devices, and related services are secure [25].

Additionally, the researchers ensure institutional approval. These are approvals from relevant ethical review boards or institutional review boards to ensure that the research design and procedures meet ethical standards and comply with relevant guidelines and regulations.

Moreover, participants would be provided with clear information regarding the purpose of data collection, how their information would be used, and their rights to withdraw their participation at any point. Informed consent forms would be obtained from participants, clearly outlining their rights and ensuring their understanding of the study's implications. Lastly, individual research participants would not be able to be identified because the research results would be given in an anonymous and aggregated form. These ethical considerations aim to prioritize participant privacy and safety throughout the research process.

3. RESULTS AND DISCUSSIONS

The study outcome showed significant findings about the relationship between Social Media Advertising and Public Perception in Panabo City. The data analysis involved a sample size of 405 participants, randomly selected from the Barangay of New Pandan, New New Visayas, San Vicente, San Francisco, and Gredu. The following is the data research presentation that is arranged accordingly: The demographic profile of the participants of the study in terms of Age Group, Gender, Barangay Resided, Social Media Mostly Used, Level of Social Media Advertising relating to Perceived Value, Attitude Towards Social Media Advertising, factors of Public Perception relating to Trustworthiness, Influence of Ad, and Overall Perception. Furthermore, a significant difference in the level of social media advertising when grouped according to Age Group, Gender, Barangay Resided, Social Media Mostly Used, a significant difference in the level of public perception when grouped according to Age Group, Gender, Barangay Resided, Social Media Mostly Used, and a significant

relationship between the level of social media advertising and public perception in Panabo City.

RQ1. What is the demographic profile of the participants of the study in terms of:

1.1 Age Group

1.2 Gender

1.3 Barangay

1.4 Social Media Mostly Used

Demographic Profile of the Participants

Table 2. AGE GROUP VARIABLE

Age Group	n	%
17-30 years old (Young Adults)	247	67.7
31-45 years old (Middle Age Adults)	77	19.0
Above 45 years old (Old Adults)	54	13.3

The majority of the sample population falls within the 17- 30 age range (young Adults), with 247 respondents (67.7), while the 31-45 age group (Middle-Aged Adults) has 77 respondents (19.0). On the other hand, the 45-year-old above (old Adult) has 54 respondents (13.3).

Table 3. GENDER GROUP VARIABLE

Gender	n	%
Female	152	37.5
Male	154	38..0
Prefer not to say	99	24.4

For the gender variable, there are 152 female participants (37.5%) and 154 male participants (38.0%). Also, Prefer not to say has 99 participants (24.4%). There are all values in this variable.

Table 4. BARANGAY POPULATION

Barangay	n	%
San Vicente	103	25.4
San Francisco	73	18.0
New Visayas	99	24.4
New Pandan	46	11.4
Gredu	84	20.7

For each barangay population variable, 103 participants (25.4%) are in Brgy. San Vicente, 73 participants (18.0%) are in Brgy. San Francisco, 99 participants (24.4%) are in Brgy. In New Visayas, 46 participants (11.4%) are in Brgy. New Pandan and 84 Participants (20.7%) are in Brgy. Gredu. There are all values in this variable.

Table 5. SOCIAL MEDIA USED

Social Media Use	n	%
Facebook	392	89.4
Messenger	292	72.1
Youtube	219	54.1
Instagram	179	44.2
Tiktok	215	53.1
Telegram	75	18.5
Thread	42	10.4
Link In	21	5.2
Twitter/X	10	2.5
Pinayflix	0	0
Pinterest	3	0.7
Discord	1	0.2
BIGO	1	0.2
What's Up	0	0
Google	1	0.2
Chrome	1	0.2
Snapchat	1	0.2

For Social Media Used, There are multiple Social Media platforms with varying numbers of participants. For the Social Media Used variable, the majority of the sample population belongs to Facebook (FB), with 392 respondents (89.4%), followed by Messenger, with 292 respondents (72.1%), and Youtube, with 219 respondents (54.1) and Instagram with 179 respondents (44.2%) also with Tiktok 215 respondents (53.1%), Telegram with 75 respondents (18.5%), Thread 42 respondents (10.4%), Link in with 21 respondents (5.2%), and twitter/X with ten respondents (2.5%). There are all values in this variable.

RQ2. What is the level of the impact of Social Media Advertising in terms of:

2.1 Perceived Value

2.2 Attitude Towards Social Media Advertising

2.3 Personal Preferences

Level of the Impact of Social Media Advertising

Table 6. IMPACT OF SOCIAL MEDIA ADVERTISING INDICATOR

Statement	MEAN	SD	INTERPRETATION
I find social media helpful advertising in my daily life.	3.67	1.26	Agree
With social media advertising increases my chance of achieving tasks that are important to me.	3.50	1.19	Agree
Social media advertising helps me accomplish tasks more quickly.	3.52	1.23	Agree

With social media advertising, it increases my productivity	3.46	1.24	Agree
SUB MEAN	3.54	1.08	Agree
Social media advertising is fun.	3.60	1.22	Agree
Social media advertising is enjoyable.	3.62	1.22	Agree
Social media advertising is entertaining	3.75	1.16	Agree
Social media advertising is essential to me.	3.55	1.21	Agree
Social media advertising is relevant to me.	3.65	1.13	Agree
Social media advertising means a lot to me.	3.54	1.25	Agree
SUB MEAN	3.62	1.20	Agree
I think social media advertising fits my interests	3.56	1.12	Agree
I think social media advertising fits with my preference	3.58	1.09	Agree
Overall, I think social media advertising fits me.	3.60	1.07	Agree
Social media advertising has become natural to me.	3.69	1.08	Agree
SUB MEAN	3.61	0.97	Agree
Overall Mean	3.59	1.08	Agree

The table above shows the impact of Social Media Advertising. The evaluation's result is based on a set of criteria ranging from 1(strongly disagree) to 5(strongly agree).

The survey results indicate that social media advertising significantly influences the respondents' daily lives in terms of perceived values, attitudes toward social media advertising, and personal preferences.

The perceived values tackle how social media ads help the respondents find what they need and achieve goals faster. It emphasizes the efficiency of social media advertising. This sub-mean builds on the previous two, suggesting that social media ads save you time and effort, allowing you to be more productive in your day-to-day activities.

While attitude towards social media advertising tackles how fun, enjoyable, meaningful, and relevant it is and how social media advertising means a lot to the respondents.

Moreover, personal preference implies that social media ads align with the respondents' hobbies and what they generally like. Respondents might see ads for products they've been wanting to try or content related to their passions. This is evident in the average mean score of 3.59, which indicates a favorable impact on respondents' everyday activities. The standard deviation of 1.08 indicates that these findings are consistent, showing that social media advertising has clearly influenced most respondents in the same way.

RQ3. What is the level of Public Perception in terms of:

3.3 Trustworthiness

3.4 Influence of Ad

3.5 Overall Perception

Level of Public Perception

Table 7. LEVEL OF PUBLIC PERCEPTION INDICATOR

Statement	MEAN	SD	INTERPRETATION
Advertising helps raise our standard of living.	3.62	1.07	Agree

I've been accurately informed after viewing most advertisements.	3.65	1.02	Agree
Most advertising provides consumers with essential information	3.78	0.95	Agree
Make necessary purchase-related decisions based on the information conveyed in advertising.	3.76	0.98	Agree
SUB MEAN	3.70	0.89	Agree
Advertising often persuades people to buy things they shouldn't buy.	3.81	1.02	Agree
It is safe to trust the information conveyed in advertising.	3.51	1.09	Agree
Recommend the product or service that I have seen/heard in advertising to my friends or family.	3.67	1.04	Agree
Advertising is transparent, authentic, and consistent.	3.63	1.09	Agree
SUB MEAN	3.65	0.90	Agree
Advertising is essential.	3.72	1.03	Agree
Most advertising insults the intelligence of the average person.	3.25	1.08	Neutral
Advertising results in better products for the public.	3.72	1.00	Agree
Advertising aims to inform the consumer.	3.82	1.01	Agree
Advertising is informative.	3.84	1.00	Agree
Advertising is a reliable source of information about the quality and performance of products.	3.77	1.05	Agree
SUB MEAN	3.69	0.78	Agree
Overall Mean	3.68	0.86	Agree

Public perception of social media advertising is multifaceted and highly dependent on the relevance, quality, transparency, and ethical considerations of the ads. Advertisers who prioritize user experience, respect privacy, and engage in socially responsible practices are more likely to foster a positive perception among the public.

Advertising helps raise our standard of living by educating and enlightening customers, boosting economic growth and innovation, assisting the media industries, encouraging healthy competition, and empowering consumers; advertising helps to improve our level of living. The average mean score of 3.76 indicates that respondents may engage in unexpected activities. Through social media, advertising enhances the overall quality of life and contributes to societal progress.

Effective advertising raises consumer awareness of products, informs and persuades them, promotes economic growth, encourages competition and innovation, educates the public, engages consumers, cultivates brand loyalty, and reaches a worldwide audience. The average mean score of 3.76 indicates that these advantages improve the general dynamics of the market and support local communities' social and economic growth.

This result focuses on time management with various aspects of social media Advertising. It presents the mean scores related to Social media advertising. Overall, the data suggest that respondents generally have a positive inclination towards the statement, wanting to set goals, prioritize, and improve their taste of what product they are choosing. Understanding time is one of the vital features that differentiates a human brain from an animal brain.

RQ4: Is there a significant difference in the level of the impact of Social Media Advertising in terms of:

1.1 Age Group

1.2 Gender

1.3 Barangay

1.4 Social Media Mostly Used

Table 8. AGE GROUP

1.1 Age Group

Parameters	M	SD	f	p	
17-30 Yrs. old (Young Adults)	3.6928	.93457			
31-45 yrs. old (Middle Age Adults)	3.4717	.95961	6.498	.002	Sig
Above 45 years old (Old Adults)	3.2057	1.07143			

The table provides a comparative statistical analysis of three age groups: Young Adults (17-30 years old), Middle Age Adults (31-45 years old), and Old Adults (above 45 years old). It reports the mean (M), standard deviation (SD), F-statistic (f), and p-value (p) for a measured parameter [26]. The mean values indicate the average scores for each group [27], with Young Adults having the highest mean score of 3.6928, followed by Middle-aged Adults at 3.4717 and Old Adults at 3.2057. The standard deviation values show the variability of scores within each group: 0.93457 for Young Adults, 0.95961 for Middle Age Adults, and 1.07143 for Old Adults. The F-statistic of 6.498 and the p-value of 0.002 suggest that the differences in mean scores among the groups are statistically significant. This indicates that the measured parameter varies significantly across the age groups, with younger individuals generally scoring higher than older individuals.

Table 9. GENDER GROUP

1.2 Gender

Parameters	M	SD	f	p	
Female	3.5336	.87996			
Male	3.5606	.99201	1.017	.363	Sig
Prefer not to Say	3.7051	1.06804			

The table presents statistical data on the parameter "Gender," comparing three groups: Female, Male, and Prefer not to Say. It provides the mean (M), standard deviation (SD), F-statistic (f), and p-value (p) for each group. Statistical Power Analysis for the Behavioral Sciences [28] Females have a mean score of 3.5336 with a standard deviation of 0.87966. In contrast, Males have a slightly lower mean score of 3.5606 and a higher standard deviation of 0.99201. The "Prefer not to Say" group has a mean score of 3.7051 and the highest standard deviation of 1.06804. The F-statistic is 1.017, and the p-value is 0.353, indicating no significant difference between the groups at the standard alpha level of 0.05. The 'Sig' in the last column implies that the p-value indicates no statistically significant difference between the gender groups regarding the parameter being measured.

Table 7. BARANGAY POPULATION

Parameters	M	SD	f	p	
San Vicente	3.8263	1.14226			
San Francisco	3.6334	.73486			
New Visayas	3.6126	.89014	4.593	.001	Sig
New Pandan	3.5600	.89119			
Gredu	3.2320	.97621			

The table shows comparative statistics for different locations: San Vicente, San Francisco, New Visayas, New Pandan, and Gredu. It includes the mean (M), standard deviation (SD), F-statistic (f), and p-value (p) for each location. [4] key foundational topics relative to descriptive and inferential statistics, including hypothesis testing, confidence intervals, z and t-tests, correlation, regression, ANOVA, and chi-square. San Vicente has the highest mean score of 3.8263, with a standard deviation of

1.14226, indicating more significant variability in responses. San Francisco has a mean of 3.6334 and the lowest standard deviation of 0.73486, suggesting more consistent responses. New Visayas has a mean of 3.6126 and a standard deviation of 0.89014. New Pandan's mean is 3.5600, with a standard deviation of 0.89119. Gredu has the lowest mean score of 3.2320 and a standard deviation of 0.97621. The F-statistic is 4.593, and the p-value is 0.001, indicating a statistically significant difference among the locations. The 'Sig' notation confirms the significance of the differences in means across these locations.

Tablet 8. SOCIAL MEDIA USED

1.4 Social Media Mostly Used					
Parameters	Paired Mean	Paired SD	t	Sig	
Facebook	2.69298	1.01727	53.255	.000	Sig
Messenger	2.86181	1.00409	57.418	.000	
Youtube	3.04506	1.03510	59.203	.000	
Instagram	3.14383	1.07738	58.724	.000	
Tiktok	3.05494	1.04958	58.575	.000	
Telegram	3.40062	1.06253	64.494	.000	
Thread	3.48210	1.01529	65.972	.000	
Link In	3.53395	.99790	70.048	.000	
Twitter/X	3.56111	.97137	71.817	.000	
Pinayflix	3.58580	.97540	74.290	.000	
Pinterest	3.75840	.97413	73.830	.000	
Discord	3.58333	.96903	74.029	.000	
BIGO	3.58333	.97137	74.418	.000	
What's Up	3.58580	.96903	74.290	.000	
Google	3.58333	.96978	74.418	.000	
Chrome	3.58333	.97301	74.114	.000	
Snapchat	3.58333	.96903	74.418	.000	

The table provides statistical data on the most used social media platforms, showing paired mean scores (Paired Mean), standard deviations (Paired SD), t-values (t), and significance levels (sig) for each platform. [1] Facebook has the lowest mean usage score of 2.69198 with a standard deviation of 1.01727 and a t-value of 53.255, indicating significant usage, as evidenced by a p-value of .000. Messenger, YouTube, Instagram, TikTok, Telegram, and Thread all have slightly higher mean scores ranging from 2.86481 to 3.48210, with their respective t-values indicating significant usage (all p-values are

.000). LinkedIn, Twitter/X, and other platforms such as Pnayflix, Pinterest, Discord, BIGO, WhatsUp, Google, Chrome, and Snapchat all show mean scores around 3.53395 to 3.58580, with t-values exceeding 70 and p-values of .000, confirming significant usage across these platforms. The consistently low p-values suggest vital statistical significance for the differences in usage patterns among these social media platforms.

RQ5. Is there a significant difference in the level of Public Perception when grouped according to:

1.1 Age Group

1.2 Gender

1.3 Barangay

1.4 Social Media Mostly Used

Table 9. AGE GROUP

1.1 Age Group					
Parameters	M	SD	f	p	
17-30 Yrs. old (Young Adults)	3.6928	.93457			
31-45 yrs. old (Middle Age Adults)	3.4717	.95961	6.498	.002	Sig
Above 45 years old (Old Adults)	3.2057	1.07143			

The table examines the variance in public perception across different age groups, explicitly comparing young adults (17-30 years), middle-aged adults (31-45 years), and older adults (above 45 years). Social connectedness is essential for health and longevity, while isolation takes a heavy toll on individuals and society. The mean (M) public perception scores are 3.7440 for young adults, 3.6361 for middle-aged adults, and 3.4257 for older adults, with standard deviations (SD) of 0.79511, 0.78491, and 0.82872, respectively. The analysis reveals a statistically significant difference between these groups, as indicated by an F-value (f) of 3.740 and a p-value (p) of 0.025, which is below the typical alpha level of 0.05. This suggests that age has a significant impact on public perception, with

younger individuals tending to have a higher mean perception score compared to older individuals. These findings align with recent studies indicating that demographic factors, including age, can significantly influence public perceptions and attitudes.

Table 10. GENDER GROUP

1.1 Age Group

Parameters	M	SD	f	p	
17-30 Yrs. old (Young Adults)	3.6928	.93457			
31-45 yrs. old (Middle Age Adults)	3.4717	.95961	6.498	.002	Sig
Above 45 years old (Old Adults)	3.2057	1.07143			

The table presents an analysis of public perception based on gender, comparing females, males, and those who prefer not to disclose their gender. The mean (M) public perception scores are 3.6034 for females, 3.6769 for males, and 3.8067 for individuals who prefer not to say, with standard deviations (SD) of 0.76498, 0.83630, and 0.80000, respectively. The analysis yields an F-value (f) of 1.932 and a p-value (p) of 0.146, indicating that the differences in public perception scores among these gender groups are not statistically significant, as the p-value is greater than the conventional threshold of 0.05. This suggests that gender does not have a significant impact on public perception in this dataset. These findings are consistent with recent research that has shown varying results regarding the influence of gender on public perception, with some studies indicating minimal to no significant differences. Today's media users experience decentralized, interpersonal, horizontal, networked, and politically relevant communication every day [29].

Table 11. BARANGAY POPULATION

Parameters	M	SD	f	p	
San Vicente	3.8263	1.14226			
San Francisco	3.6334	.73486			
New Visayas	3.6126	.89014	4.593	.001	Sig
New Pandan	3.5600	.89119			
Gredu	3.2320	.97621			

The table examines the differences in public perception across five barangays: The influence of local context on public perception [30]. San Vicente, San Francisco, New Visayas, New Pandan, and Gredu. The mean (M) public perception scores are 3.9144 for San Vicente, 3.6640 for San Francisco, 3.6208 for New Visayas, 3.6526 for New Pandan, and 3.4963 for Gredu. The standard deviations (SD) for these barangays are 0.93504, 0.66648, 0.77450, 0.75764, and 0.74369, respectively. The analysis reveals a statistically significant difference in public perception among the barangays, as indicated by an F-value (f) of 3.533 and a p-value (p) of 0.008, which is below the 0.05 threshold. This suggests that the barangay of residence significantly influences public perception. These findings highlight the importance of geographical and community context in shaping public opinions, consistent with studies that have demonstrated the impact of local environments on public attitudes and perceptions.

Table 12. SOCIAL MEDIA MOSTLY USED

1.4 Social Media Mostly Used					Sig
Parameters	Paired Mean	Paired SD	t	Sig	
Facebook	2.78721	.85350	65.719	.000	
Messenger	2.96005	.86384	68.960	.000	
Youtube	3.14030	.87547	72.187	.000	
Instagram	3.23906	.93688	69.576	.000	
Tiktok	3.15017	.92493	68.541	.000	
Telegram	3.49585	.92592	75.981	.000	
Thread	3.57733	.89138	80.765	.000	
Link In	3.62919	.85655	85.267	.000	
Twitter/X	3.65635	.82981	88.674	.000	
Pnayflix	3.68104	.80311	92.241	.000	
Pinterest	3.67363	.80628	91.693	.000	
Discord	3.67857	.80649	91.792	.000	
BIGO	3.67857	.80058	92.471	.000	
What's Up	3.68104	.80311	92.241	.000	
Google	3.67857	.80058	92.471	.000	
Chrome	3.67857	.80649	91.792	.000	
Snapchat	3.67857	.80058	92.471	.000	

The table "Social Media Mostly Used" presents a statistical analysis of the usage of various social media platforms, listing paired mean scores, standard deviations (SD), t-values, and significance levels. The data indicates significant differences in usage among platforms like Facebook, Messenger, YouTube, Instagram, TikTok, Telegram, and others, with paired mean scores ranging from 2.78721 (Facebook) to 3.68104 (Pnayflix, WhatsApp, Google, Chrome, and Snapchat). Paired SD values reflect variability in usage, and high t-values (e.g., 65.719 for Facebook and 92.471 for BIGO) along with significance levels of .000 show these differences are statistically significant.

Recent studies support these findings, showing diverse user engagement across platforms. For instance, one highlights the widespread and varied use of social media globally [31] while confirming significant differences in user preferences and engagement across different social media platforms [32].

RQ6. Is there a significant relationship between Social Media Advertising and Public Perception?

Relationship Between Social Media Advertising and Public Perception

Table 13. RELATIONSHIP BETWEEN SOCIAL MEDIA ADVERTISING AND PUBLIC PERCEPTION

Variables	r-value	r ²	p-value	Decision
Social Media Advertising and Public Perception	.869	.755	.000**	Reject Ho

****.** Correlation is significant at the 0.01 level (2-tailed)

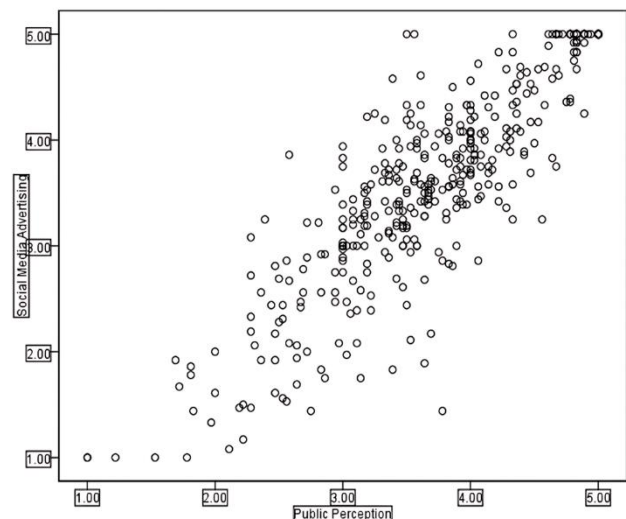

A Pearson correlation coefficient was performed to evaluate the relationship between Social Media Advertising and Public Perception. The results showed a significant and highly positive relationship.

The Pearson correlation analysis shows a strong positive and statistically significant relationship between Social Media Advertising and Public Perception, with a high r-value of 0.869 and an r^2 of 0.755. The p-value of 0.000 indicates that this result is highly significant [33], leading to the rejection of the null hypothesis, which would have suggested no correlation. This suggests that effective social media advertising is likely to improve public perception.

RQ7. Does Social Media Advertising give impact on the Public Perception in Panabo City?

Impact of Social Media Advertising on Public Perception

Table 14. SCATTER PLOT OF THE RELATIONSHIP BETWEEN SOCIAL MEDIA ADVERTISING AND PUBLIC PERCEPTION

In this case, the variables being compared are social media advertising and public perception. The data consists of 405 observations.

The data points display a clear upward trend, indicating a positive correlation between the two variables. This trend supports the statistical analysis, which showed a strong positive correlation coefficient ($r = 0.869$) and a significant p-value ($p = 0.000$), confirming the relationship's significance at the 0.01 level.

The graph shows a general upward trend in the data points, suggesting that as social media advertising increases, public perception also tends to increase. The data points are scattered around a general upward trend, meaning that the relationship between the two variables is not perfectly linear. Social media advertising also helps in the long term as consumers establish more and more trust and perceived value. When consumers have needs, the companies have a high likelihood of a consumer purchasing a product [34]. The positive and significant correlation highlights the importance of social media advertising as a strategic tool for enhancing public image and engagement in the perception of the public.

Overall, the scatterplot suggests a strong positive relationship between Public Perception and Social Media Advertising. Higher public perception ratings are associated with higher social media advertising ratings, implying that entities perceived positively by the public are also rated highly for their social media advertising efforts.

4. CONCLUSIONS AND RECOMMENDATIONS

4.1 Conclusions

This research study concluded that students must recognize the significant association between Exploring the Impact of Social Media Advertising. They must understand that their use of social media advertising may impact their overall well-being. The levels of social media advertising are commonly visible

and at high levels. Regarding the relationship between exploring the impact of social media advertising, the data demonstrate an essential positive relationship between the efficacy of social media advertising.

Modern marketing strategy must include social media advertising as a vital and dynamic element. Due to its broad audience reach, tailored and targeted content, and quantifiable outcomes, social media advertising is a priceless tool for companies looking to improve their brand visibility and meet their marketing goals. Nonetheless, continual innovation, adaptability, and a deep comprehension of user behavior and platform dynamics are necessary for success in social media advertising.

4.2 Recommendations

The recommendation is made based on the findings and conclusion of the study. Businesses should tailor ads to different age groups, focusing on younger adults who respond more positively. They should customize ads for various barangays, especially where people view them more favorably, like in San Vicente. Prioritize popular platforms such as Facebook, Messenger, and YouTube, and also consider LinkedIn and Twitter/X for their positive reception among users. Create ads that are engaging, entertaining, and relevant to the audience's interests, using interactive content and local influencers. Ensure ads are transparent and honest, providing clear information and avoiding misleading claims while collecting customer feedback to improve them.

Regularly check ad performance and adapt as needed, staying updated with social media trends and changes in consumer preferences. By following these recommendations, businesses can enhance their social media advertising, positively influence public perception, and increase engagement and conversions.

These findings suggest that effective social media advertising campaigns are likely to improve public perception. Organizations should

consider investing in social media advertising strategies to positively influence public perception and achieve better outreach and connection with their target audiences.

ACKNOWLEDGEMENT

We are Davao del Norte State College students studying for a B.S. in Information Systems. We value our collaboration with Professor John Philip Paja, our research advisor and quantitative methods instructor, taught us a lot with his words of wisdom and encouragement. Ms. Jessa Albit, our statistician, deserves our thanks and praise for all her hard work. Above all, we are grateful to Him for leading us and providing us with the insight, fortitude, and drive to achieve in this study.
